

## CREATING THE WEBSITE CONTENT TYPE

Now create your second custom content type: Website. This gives your visitors information about useful Drupal sites.

1

- Go to “Manage”, then “Structure”, then “Content types”.
- Click “Add content type”.

Enter the following information.

2

- Title: **Website**
- Description: **This is where you enter information about useful Drupal websites and resources.**
- Title field label: **Website Name**

Save the content type. Now, we’ll add a Website example.

3

- Click “Shortcuts”, then “Add content”.
- Click “Website”.

Enter the following information:

4

- Website Name: **Drupal.org**
- Body: **Drupal.org is the official homepage of Drupal. Here you can find documentation, support, downloads, and much more.**

## FIELDS FOR THE WEBSITE CONTENT TYPE

We are going to add four new fields to the Website content type:

- Screenshot
- Comments
- Is this an Official Drupal Site?
- Website Link

### Editing a Field: Website Description

When you created a content type, you weren’t given an opportunity to choose the label of the Body field. Let’s rename the field so it has a more appropriate label for our Website content type.

5

- Go to “Manage”, “Structure”, and then “Content types”.
- Click “Manage fields” next to Website.
- Click “Edit” next to Body.

- 6 • Change the label from **Body** to **Website Description**.

- 7 • Click “Save settings” at the bottom of the page.

A machine name is used for all sorts of technical purposes in Drupal. For example, the data for this field is stored in a database table that uses the machine name. This is why you can't change the machine name after you've created it.

- 8 • Go to “Manage”, “Structure”, and then “Content types”.
  - Click “Manage fields” next to Website.
  - Click the “Add field” button.
  - Select **Image: field\_image** from the “Re-use existing field dropdown”.

- 9 • Label: **Screenshot**
  - Click “Save and continue”

- 10 • Help text: **Upload a screenshot of the home page for this site.**
  - You can read through the other settings, but we'll return to some of these later.
  - Click “Save settings”.
  - Check that your new Screenshot field is visible:

- 11 • Make sure you are on the Manage Fields page for the Website content type.
  - Click the “Add field” button.
  - Click the “Re-use existing field” drop-down and select **Comments: comment**.
  - Click “Save and continue”.
  - Keep the default settings.
  - Click “Save settings”.
  - Check that your new field is visible:

## Adding a Field: Official Website

Now let's explore how to create new fields.

This field enables the content author to show whether the site is an official Drupal site. The Boolean field option would be perfect for this because it provides an either/or choice. A Boolean field is an excellent option for choices such as Yes/No and True/False.

For the Official site field, the site will be listed as either an official site (true) or not an official site (false). Let's add this field.

12

- Make sure you are on the Manage Fields page for the Website content type.
- Click the "Add field" button.
- Add a new field: **Boolean**
- Label: **Official Website**

13

- Click "Save and continue".
- Allowed number of values: keep as 1.
- Click "Save field settings".
- Scroll down and enter **This is an official Drupal website** and **This is not an official Drupal website**.

14

- Click "Save settings".
- Notice the new field is now added to the list.

15

- Click the "Add field" button.
- Add a new field: **Link**
- Label: **Website Link**
